Experience

Data Engineer at Clarivate

Apr 2025 – Present

Belgrade, Serbia

- Contributed to data processing pipelines for intellectual property data products.
- Designed and maintained data pipelines for entity resolution and company matching to ensure consistency across global corporate structures.
- Worked on large-scale data transformation and enrichment processes for patent-related analytics and reporting systems.
- Technologies: Python, Apache Spark, Apache Airflow, DuckDB, MySQL, Kubernetes

Data Engineer at WeDoSoftware

Jan 2024 – Apr 2025

Novi Sad, Serbia

- Worked on a data lake architecture for a media processing use case involving automated clipping and proofreading workflows.
- Designed and implemented ETL pipelines supporting data preprocessing, model retraining, inference, and serving for automated proofreading workflows.
- Developed and maintained an inference service for hosting and serving AI models via API, integrated with downstream system components.
- Technologies: Python, Apache Spark, Apache Iceberg, Microsoft Fabric, FastAPI, PostgreSQL

Freelance Software Engineer at Upwork

Nov 2023 – Dec 2024

Novi Sad, Serbia

- Worked on multiple freelance projects involving backend services and data engineering solutions.
- Contributed to the development of backend services, data processing pipelines, and analytics-oriented systems.
- Worked with containerized environments to support deployment and reproducibility of services.
- Technologies: Python, Apache Spark, PostgreSQL, FastAPI, Docker, AWS, Azure

Data Engineer Internship at SmartCat

Aug 2023 – Nov 2023

Novi Sad, Serbia

- Contributed to a lakehouse architecture solution for a betting industry use case.
- Designed and maintained batch and streaming data pipelines to enable real-time KPI monitoring and periodic reporting.
- Supported the development and maintenance of CI/CD pipelines to automate and streamline data infrastructure deployments.
- Technologies: Databricks, Apache Spark, Delta Lake, Apache Kafka, Kafka Streams, Docker, AWS Lambda, GitHub Actions

Software Engineer Internship at Synechron

Feb 2023 – Apr 2023

Novi Sad, Serbia

- Contributed to the development of a simulation of a car insurance platform for managing policies and customer data.
- Developed authentication and authorization mechanisms for a microservices-based architecture.
- Designed and implemented database models to support application functionality and ensure data integrity.
- Technologies: Python, Flask, PostgreSQL

Projects

Grit Marketing Data Platform

- Designed and implemented an end-to-end marketing data platform integrating multiple advertising and lead-generation sources (Google Ads, Facebook Ads, LeadsHook, LeadsPedia).
- Implemented Medallion architecture to support raw ingestion, data quality validation, and analytics-ready data modeling.

- Developed ETL pipelines and SQL transformations for campaign performance tracking and lead conversion analytics across channels.
- Provisioned cloud infrastructure and containerized data workloads to enable reproducible deployments and scalable processing.
- Technologies: Python, Terraform, AWS S3, AWS Fargate, AWS Step Functions, DuckDB, PostgreSQL

Scientific Knowledge Graph Platform

- Built a serverless scientific-claims processing platform on AWS that orchestrates OCR, knowledge-unit extraction, claim detection, relation embedding/clustering, and graph construction.
- Developed an event-driven workflow to automate end-to-end job execution and state tracking across pipeline stages.
- Designed backend storage for metadata, workflow state, final claim outputs, and graph/query artifacts to support reliable retrieval and traceability.
- Implemented API endpoints for workflow triggering, workflow-state monitoring, final result retrieval, and claim-graph querying over processed paper collections.
- Technologies: Python, Terraform, AWS Lambda, AWS API Gateway, AWS Step Functions, AWS DynamoDB, AWS S3

Vehicle Routing Optimization System

- Built an optimization system for generating delivery routes for trucks, reducing manual route planning effort.
- Implemented ALNS-based VRP optimization with weighted distance and time objectives for multi-stop delivery routing.
- Developed KPI computation and reporting modules, including automated reports comparing manual and optimized routes.
- Technologies: Python, OpenRouteService, OSRM, Pandas

Gazer Data Platform (Master Thesis Project)

- Designed and implemented a GitHub analytics platform following Lambda and Medallion architecture principles.
- Built batch and streaming data pipelines for ingestion, transformation, and KPI computation over large-scale GitHub event datasets.
- Integrated data from GH Archive and GitHub GraphQL API to enable repository, organization, and contributor analytics.
- Developed multidimensional analytics and ranking capabilities with interactive dashboards for data exploration.
- Technologies: Python, Scala, Apache Spark, Apache Iceberg, Apache Kafka, Kafka Streams, Apache Airflow, PostgreSQL, Apache Superset, Docker

Education

M.Sc. in High-Performance Computing	2023 – 2026
<i>Faculty of Technical Sciences, University of Novi Sad</i>	

B.Sc. in Computing and Control Engineering	2019 – 2023
<i>Faculty of Technical Sciences, University of Novi Sad</i>	

Certifications

Data Engineering Bootcamp	Jul 2025
<i>DataExpert.io</i> Credential Link	

Introduction to Kubernetes	Aug 2024
<i>The Linux Foundation</i> Credential Link	

Azure Data Fundamentals	Aug 2024
<i>Microsoft</i> Credential Link	

Databricks Lakehouse Fundamentals	Aug 2024
<i>Databricks</i> Credential Link	

Apache Kafka Series - Apache Kafka for Beginners	Mar 2023
<i>Udemy</i> Credential Link	

Achievements

Winner – Data Engineering Challenge: From Matches to Metrics

Nov 2024

Nordeus

Three-day data engineering challenge focused on designing a scalable data storage and processing architecture for efficient metric computation and fast statistical querying of game data.

Winner – Artificial Intelligence BattleGround v4.0

May 2024

Board of European Students of Technology (BEST)

24-hour hackathon focused on developing an AI strategy bot for the board game Alien WarZ. Designed and implemented a game-playing strategy involving path planning, resource collection, factory construction, opponent base attacks, and strategic use of in-game upgrades to gain competitive advantage.

Winner – Games of Code v2

Feb 2023

barKod

Two-day hackathon consisting of four challenges across AI, DevOps, Data Engineering, and Cybersecurity. Developed solutions for a recommendation system, automated code vulnerability and secret scanning, real-time analytics pipeline, and a capture-the-flag security task.
